Digital Modeling: the process of creating a computer model of an object that exactly replicates the form of the object. Laser scanners are used to capture the 3D data of the object, and this data is transferred to the computer where it is aligned, edited and finalized as a complete 3D model. A digital elevation model (DEM) is a 3D computer graphics representation of elevation data to represent terrain, commonly of a planet (e.g. Earth), moon, or asteroid. A "global DEM" refers to a discrete global grid. DEMs are used often in geographic information systems, and are the most common basis for digitally produced relief maps. While a digital surface model (DSM) may be useful for ...

Modeling methods for digital twins: first principles and data-driven. The models must be kept up-to-date and tuned to the assets that are in operation, which typically involves direct streaming of data from the assets into algorithms that tune the digital twin. This allows you to consider aspects like asset environment, age, and configuration.
